Burndown Chart:

Our burndown chart shows a decreasing line, demonstrating that we added all of the user stories we wanted at the beginning of sprint 2, worked on them over the course of the sprint, and ultimately finished all but one by the end of it. There is one upward spike because we added one user story in the middle of the sprint, SCRUM-12. This was because we had initially separated the chat feature into two components, messaging and image/file sharing, and were only going to focus on the former for this sprint. However, as we began working, we learned that the API we planned to use encompassed both aspects, so adding SCRUM-12 to this sprint made sense. Other than that, the line is decreasing, with more work completed during the last week of the sprint. This was due to the fact that many group members had other commitments such as midterms for other courses, preventing several of us from working on our tasks until later on in the sprint.
*Please note we were given a 2-day extension, so the sprint end date in the chart shows July 7 instead of July 5.

Velocity Report:

Our sprint 2 velocity was slightly different than that of sprint 1. In sprint 1, we completed all story points that were committed. However, for sprint 2, one of our group members had a personal emergency, preventing them from completing one of their tasks. Due to this, our commitment was slightly higher than our completion. Going forward, we will work to ensure the incomplete story is finished during sprint 3, and we will increase our velocity back to how it was in sprint 1.
